

ABSTRACT

[039] A vehicle seat linkage assembly includes a rod. The linkage has a first link with an aperture and a second link adjacent but spaced from the first link and having a slot. Additionally, a drive nut is adjacent the rod. The drive nut has a body portion, one end, another end and an aperture engaging the rod. The one end is inserted into the slot and the another end is inserted into the aperture. When the nut is disposed into the slot and aperture, the nut is rotated to engage the slot and the aperture so that the nut cannot be disengaged from the first link and the second link.
